ABSTRACT:

Artificial Intelligence is an emerging technology. Artificial Intelligence is a branch of computer science that works on to create a computer system capable to react like a human being. Smartness in technology is increasing day by day. Machines are now a part of our life and are used commonly. With the increasing super intelligent devices and smartness, the humans desire furthermore smarter technology. When we say intelligent machine, it does not mean that it is a machine which can solve any complex program that even humans get troubled. As days are progressing the human race is travelling towards a kind of locked situation where in, smartness of devices must be improving, and the progress can't be rolled back. In this regard super intelligence systems may spell the end of human race considering the humans of no use to them. In this paper we are going to present how artificial intelligence is threat to human race and its conclusions.
